Descriptors- \*Federal Aid, Federal Programs, \*Financial Needs, \*Financial Problems, \*Higher Education, Institutional Role, Universal Education

Although American higher education now has the opportunity to make significant contributions to the national welfare, the rapid expansion of colleges and universities and the exhaustion of state tax potential have produced a critical situation in public higher education. Massive increases in enrollments at both the undergraduate and graduate levels are threatening the quality of higher education and jeopardizing universal educational opportunity. Both public and private institutions have suffered serious financial strains in the past decade from the pressures of inflation, necessary salary increases, the explosion of knowledge, and educational technology. Inability to meet rising tuition costs has caused an extensive loss of talent. To help solve the institutions' financial plight, a broad and substantial program of federal support is recommended. Appendices contain data on enrollments, institutional expenditures, state, federal and local expenditures and sources of revenue, family income of students, and talent loss. (JS)

## AN OPPORTUNITY for a Major American Advance Through Higher Education

Not since the Civil War when Abraham Lincoln signed the Land-Grant Act, and put the influence and resources of the federal government behind widespread availability of higher education and practical application of university research, has there been such an opportunity for significant national advance as now presents itself.

1. American social and technological development has now produced an almost unlimited demand for the college-educated and is steadily reducing the need for expending human resources on routine work;

2. The past decade has brought vast improvements in primary and secondary education, both in the percentage of young people reaching high school graduation and in the quality of the graduates and their preparation for further education;

3. There is broad acceptance of college-going as a normal educational progression by the current generation of American young people, their families, and national leaders;

4. Agricultural progress under the impetus of federally-supported university research and extension has been so spectacular that demands for speeding industrial and cultural advance in much the same fashion are now loud and clear;

5. Wide-spread recognition that all of society benefits from the higher education of its youth, the retraining of adults, the application of university research, and the extension of university services has stilled old fears about

federal aid to higher education; indeed has brought broad public agreement that a massive program of such aid is justified on the basis that it can bring a major advance in American life and in American efforts toward a peaceful and progressing world.

To achieve the major advance which this paper will outline in some detail will require the combined efforts of all post-high school educational institutions in the nation, from the small private liberal arts colleges to the great public university systems. And it will require federal aid in such forms and such volume as will strengthen all institutions from the very weakest predominantly Negro public colleges to the prestigious private universities, enabling the full range to upgrade the quality of their services and open their doors to all who can benefit from higher education--especially the economically disadvantaged in American society.

The path to great achievements in cultural, social, economic, and scientific advance is well established. Simply put, it is the education of all Americans to their highest potential and the fullest possible use of the special resources of our educational institutions for research and extension.

As they have in the past century and particularly in the past decade, public colleges and universities must be expected to carry an increasing proportion of the initiative for national advance. To gear them to do so, federal funding plans must recognize and remedy the critical situation that rapid expansion and exhaustion of state tax potential have now brought about in public higher education.

## ENROLLMENT, the Nub of the Crisis in Public Higher Education

In the past five years, with inadequate financing, public institutions of higher education in the United States have been asked to add instructional strength greater than that attained by the nation's private institutions in the 330 years since the founding of Harvard College.

That is the nub of the crisis in public higher education today.

Private institution enrollments this year total just over 2-million. Public institutions have increased that much since 1961. As recently as 1951 enrollments in private colleges and universities were higher than those in public. This year, public institutions teach twice as many as private. (Appendix C)

The struggle to meet this challenge has left all but a handful of excellent public institutions with a disgraceful quality deficit which must be remedied if a firm base is to be built for national advance through higher education.

For, contrary to the general assumption, the added enrollments have not been absorbed in the main by the expansion of public junior colleges. Established public universities have handled a greater share. (Appendix D)

And the burden of public institution enrollment increases has not been confined to the less costly undergraduate years.

Private institutions now enroll 250-thousand graduate students; public institutions have

increased graduate enrollments by more than that in the past decade. (Appendix B)

Just ten years ago graduate enrollments in private colleges and universities were higher than those in public. U.S. Office of Education projections indicate that public institutions will enroll twice as many graduate students than private institutions will within eight years from now.

This year, first time enrollments in private higher education actually were less than those of the previous year, while first time enrollments in public institutions increased more than 100-thousand. (Appendix C) Freshman applications for next fall in the Ivy League and Seven Sisters--usually flooded with applications--are up only 3.5 per cent, while state and land-grant institutions are averaging a 9.4 per cent increase. (Appendix E)

Strong indications that public colleges and universities are nearing the limit of expansion without massive federal help are evident throughout the land. One of every seven public universities will reject qualified in-state applicants next fall; two of every seven will reject qualified out-of-state applicants. One of every ten raised admission standards for in-state students this year; one of every six raised standards for out-of-state students. (Appendix F)

The American dream of a century ago--that the qualified sons and daughters of the nation's farmers and laborers would have an opportunity for higher education--is in jeopardy.

## THE QUALITY DEFICIT--Rapid Expansion Without Adequate Financing

Public institutions of higher education in the United States are now operating at a quality deficit of more than a billion dollars a year.

In addition, despite heavy construction schedules, they have accumulated a major capital lag.

On the basis of U.S. Office of Education projections of expenditures and enrollments, public higher education will be short of a reasonable standard of educational funding by \$2.5 billion a year, by 1975.

All institutions of higher education--public and private--have suffered serious financial strains in the past decade from the pressures of inflation, necessary salary increases, the explosion of knowledge, and the technology of education. But the most severe stress--rapid enrollment increases--fell heavier upon the public institutions, and their resources did not prove equal to the task. The deficits cited above are merely a computation of the costs, in 1965-66 dollars, to bring public institution expenditures per student to the expenditure level of private institutions, and do not include the deterioration in private education financing.

Public institutions actually spent more per student than private in the fifties. In the latter half of the fifties, or the early sixties (depending on the elements considered in student educational costs) private institutions invested a rapidly growing amount in each student's education.

By 1963-64, private institutions were spending well over \$300 per student more than public institutions. (Appendix H) This included \$96 more for instruction and departmental research, \$18 more for libraries, \$48 more for plant operation and maintenance, and \$150 more for administration and general expenses.

In the period 1953-54 through 1963-64, per student library expenditures rose 30 per cent in public institutions, 85 per cent in private; instruction and departmental research rose 17 per cent in public institutions, 64 per cent in private.

In areas outside those normally included in student education costs, the story was the same or worse: Student aid expenditures went up 71 per cent per student in public institutions, 135 per cent in private. Organized research funds--a critical factor in attracting and holding a quality faculty--went up 105 per cent per student in public higher education, 289 per cent in private.

The ratio of undergraduates to regular faculty deteriorated in public universities during the 1953-64 period from 10.61 to 11.71, while it improved in private universities from 8.78 to 7.17. (Appendix I)

During this critical period, public universities apparently chose to increase teaching loads to conserve limited funds for faculty salary increases. But they lost ground in the past five years, and continue to lag seriously, both in salary and total compensation, behind the independent private universities. (Appendix J)

## TALENT LOSS--Pricing Students Out of Educational Opportunity

As enrollments in public higher education skyrocketed, states and communities, which traditionally were its major sources of support, did not meet their share of the rising student education costs. Shares provided by private gifts, grants, and endowment earnings also declined. There was some instructional support improvement from the federal government, mostly in land-grant institutions. But what cost rises could not be pared away by increasing class sizes, deferring library purchases, and making similar "economies," were met by raising student fees. (Appendix K)

Public institutions increased their per student income from fees and tuitions 49 per cent in the 1953-64 decade, but were obliged to hold their educational expenditures per student to a 17 per cent rise.

While private institutions traditionally have financed at least half of their instructional costs with tuitions, and the historic pattern of public education has been tuition-free, the share of educational costs borne by students rose much faster in public institutions than in private in this decade; up more than 22 per cent in public institutions, less than 10 per cent in private. Meantime student aid went up only 7 per cent per student in public institutions while it rose 135 per cent in private (Appendix H)

While lower-cost public institutions still attract many more students from low-income homes than private institutions do, public

institution tuitions are rising faster than family incomes, (Appendix L) and may thus be pricing a growing number of qualified high school graduates out of an opportunity for higher education.

Forty per cent of the families in the United States have incomes under \$6,000. Less than 20 per cent of last year's freshmen in all of higher education came from families below that level. Freshmen from such families made up only 16.3 per cent of those entering public universities, 11 per cent of those entering private. (Appendix M)

Less than eight per cent of all families have incomes of \$15,000 or more, but more than 20 per cent of all college freshmen come from families with incomes that high. In public universities the percentage is 11.6, in private, 26.1.

The annual national talent loss--failure of the qualified from low income families to enter higher education--has been estimated by the U.S. Office of Education at 263,000 this year if those in the upper academic half of high school graduates are counted; 411,200 if the range is extended to the top 63 per cent. (Appendix N)

Extensive scholarship, loan, and work-study programs have not solved the problem. A roll-back in fees and tuitions is an obvious solution, since the proportion of students from low-income families is greatest in low-cost institutions. Thus a major part of any effective federal funding program to advance the nation through higher education must be provision for tuition reduction and expansion of low-cost commuter institutions.

## THE FINANCIAL PLIGHT of United States Public Higher Education

While many of the finest public institutions of higher education began with federal grants, and others trace their beginnings to private endowments, for the past century state and local taxes have been the main source of their financing.

In 1953-54, 78.9 per cent of their educational and general expenses were met by state and local taxes. This percentage had dropped to 69.3 by 1963-64; it seems likely that today less than two thirds of this support can be expected from state and local taxes.

The great burdens of financing primary and secondary education, the rise in the proportions of senior citizens, and the enormous demands of modern metropolitan sprawl all fall primarily upon these tax sources. Among the new demands made upon state and local taxes are programs aimed at support for private higher education. Local government payments increased from \$4 million in 1955 to \$14 million in 1966; state payments from \$30 million to \$100 million in the same period.

State and local expenditures, excluding federal aids, climbed from \$20 billion to \$64 billion from 1950 to 1965. National expenditures for domestic functions and services increased only from \$15 billion to \$26 billion in the same period. (Appendix O)

Across the nation the increasing burden of state and local taxes is meeting sharp resistance today. Competition among the states and cities for industrial and commercial growth has virtually ended further major tax increases at these levels.

Furthermore, regressive forms of taxation have largely provided the added state and local revenues in the recent past; property taxes accounted for 44 per cent of the increase, 1950-65, sales taxes 34 per cent. Corporation and individual income taxes provided only 13 per cent. (Appendix P)

It is quite clear that even a national economic growth rate of 5 per cent per year will not produce enough additional revenue from existing state and local taxes to keep pace with future enrollment increases and rising instructional and operational costs. For the need is advancing more than 5 per cent per year, and the state and local tax base is relatively unresponsive to economic growth.

If present financial deficiencies in the public institutions of higher education are to be remedied, and their fullest possible contributions to national advancement are to be realized, sources beyond state and local taxes and student fee income must be found.

Public institutions, aware of the crisis, have stepped up efforts to increase private gifts and grants, particularly from their alumni. While these efforts have been productive, particularly for public universities, their share of such support remains at about 15 per cent of the total voluntary support for higher education.

If public higher education is to make the future contributions it can, major federal support for these institutions must be forthcoming.

## FOR THE FUTURE--Higher Education for All Qualified Who Want It

Higher education today is as common a personal goal for Americans as secondary education was before World War I. If we had attempted to finance secondary schooling by raising tuitions, it is doubtful that we could have reached the 94 per cent of school-age population now enrolled. We achieved it, in the main, in our states and communities, by taxing ourselves in faith that the education of our children was a social responsibility and would provide broad benefits to all society.

The opportunity for a major American advance now is possible through the application of this principle at the higher education level, though state and local funding potential is exhausted.

### WHAT MUST BE DONE:

1. A broadly conceived and substantial program of federal support for higher education can shift the burden of financing from student fees and tuitions, diminishing gift and endowment potentials, and inflexible, regressive, and inequitable state and local taxes, to more flexible, progressive, nationally-uniform federal taxes.
2. This support must be institutional and should be computed on a per-student basis, if it is to reach existing inadequacies and keep pace with rising enrollments.
3. Since educational costs may be expected to rise in the future, the program must be continuously readjustable to current outlays.
4. It should recognize the wide disparity in the costs of providing beginning undergraduate, upper division undergraduate, graduate and professional training.
5. Within these levels, per-student allocations must be the same for all institutions to avoid perpetuating current quality inequities.
6. A minimal program of federal support should provide at least 25% of the instructional and operating costs, starting at about \$2.2 billion in 1968 and rising to \$3.9 billion by 1975.
7. Most of the institutional support should be in addition to existing expenditures, if it is to place a floor under quality and a ceiling on the burden borne by the student. Tuition reduction must be encouraged.
8. Incentives must be offered to enable existing institutions to accept more students. The present trend of college-going to public institutions should be slowed and private institutions encouraged to grow.
9. The quality differences among institutions should not be cured by levelling down. Special programs for the best institutions (public and private) should supplement the general effort.
10. The best way to reach the "talent loss" among the lower income families and open the doors of educational opportunity for two-thirds of our high school graduates is by providing varied educational opportunities inexpensively and close to home.

TABLE 4.—Total opening fall degree-credit enrollment in all institutions of higher education; by sex, by attendance status, and by control of institution: United States, 1955 to 1975<sup>1</sup>

1975-----	8,995,000	5,218,000	3,777,000	6,269,000	2,725,000	6,315,000	2,680,000

<sup>1</sup> SOURCES: Enrollment data and estimates are based on U.S. Department of Health, Education, and Welfare, Office of Education circulars: (1) "Opening (Fall) Enrollment in Higher Education," annually, 1955 through 1965; and (2) "Resident and Extension Enrollment in Institutions of Higher Education," biennially, 1955 through 1961.

Population on which projections are based is shown in appendix table E.

<sup>2</sup> Total opening fall degree-credit enrollment by attendance status for 1955 through 1961 is estimated from 1st-term enrollment by attendance status reported in "Comprehensive Report on Enrollment" surveys, biennially, 1955 through 1961.

<sup>3</sup> The projection of total opening fall degree-credit enrollment in all institutions of higher education by sex and control of institution is based on the assumption that attendance rates of men and women aged 18-21 years will follow the 1955-65 trend to 1975 in each category of enrollment.

The projection of total opening fall degree-credit enrollment in all institutions of higher education by attendance status is based on the assumption that in each enrollment category the 1965 ratio of full-time enrollment to total enrollment will remain constant to 1975.

The projections include in each year, in addition to the number of enrollments based on the 1955-65 trend, an estimated 66,000 veterans enabled to attend college through aid provided by the Veteran's Readjustment Benefits Act of 1966. Veterans who would have attended without this assistance are assumed to be included in the trend projections.

For further methodology details, see appendix table A.

NOTE.—Data are for 50 States and the District of Columbia for all years. Because of rounding, detail may not add to totals.

<sup>1</sup> SOURCES: Enrollment data and estimates are based on U.S. Department of Health, Education, and Welfare, Office of Education publications: (1) "Opening (Fall) Enrollment in Higher Education," annually, 1955 through 1965; (2) "Resident and Extension Enrollment in Institutions of Higher Education," biennially, 1955 through 1961; and (3) "Survey of Residence and Migration of College Students," fall 1963.

<sup>2</sup> Total opening fall degree-credit enrollment by level and attendance status was estimated from 1st-term enrollment by level and attendance status reported in "Comprehensive Report on Enrollment" surveys, biennially, 1955 through 1961 and in the "Residence and Migration of College Students" survey, fall 1963. The estimates were adjusted to agree with enrollment by attendance status reported in the "Opening Fall Enrollment" survey, 1962 through 1965.

<sup>3</sup> The projection of graduate opening fall degree-credit enrollment in 4-year institutions of higher education by sex and by control of institution is based on the assumption that in each

enrollment category the proportion of total enrollment at the graduate level will continue the 1955-63 trend to 1975.

The projection of graduate opening fall degree-credit enrollment in 4-year institutions by attendance status is based on the assumption that in each enrollment category the estimated 1965 ratio of full-time enrollment to total enrollment will remain constant to 1975.

The projections include in each year, in addition to the number of enrollments based on the 1955-63 trend, an estimated 7,000 veterans enabled to attend college through aid provided by the Veteran's Readjustment Benefits Act of 1966. Veterans who would have attended without this assistance are assumed to be included in the trend projection.

For further methodology details, see appendix table A.

NOTE.—Data are for 50 States and the District of Columbia for all years. Because of rounding, detail may not add to totals.

## Applications for Admission, 1967-68

Higher Education, Vol. XVI, No. 15

Freshman applications for next fall show increases over last year of approximately 3.5 percent at Ivy League colleges and the women's colleges in the Seven College Conference, and an average of 9.4 percent at state and land-grant institutions, two independent surveys reported this week.

The 9.4 percent increase in applications at state and land-grant institutions is based on figures obtained from 82 of the 99 members of the National Association of State Universities and Land-Grant Colleges (NASULGC), the association's Office of Institutional Research reported. It said the figure "absorbs decreases of at least one percent registered at 14 institutions," and continued: "Another five institutions reported no significant change in applications (i.e., increases or decreases of zero or less than one percent). Last year, 23 out of 65 reporting institutions had decreases or no significant changes; and, in 1965, only six institutions failed to show an applications increase. At the other end of the spectrum, 12 institutions reported applications increases of 20 or more percent. Four reported increases of 15 to 19.9 percent, and 18 reported increases of 10 to 14.9 percent."

The association said the largest regional increase in applications among its members came in the South, where 33 institutions reported 11.71 percent more applications than last year. These institutions received a total of 90,321 applications for 68,000 available places, or 1.31 applications per place. The next largest increases were registered in the Northeast and the West, where applications rose 10.24 and 10.25 percent respectively. Sixteen Western institutions reported receiving 56,819 applications for 51,406 available places, or 1.11 applications per place.

"As in the past," the association reported, "the crush is greatest this year in the Northeast. The ten reporting Northeastern institutions have received more applications than the 33 reporting Southern institutions, but have fewer than half as many available places. The ten Northeastern institutions have received 100,212 applications for 27,950 places, or 3.59 applications per place. Finally, the Midwest showed the smallest regional applications increase--5.78 percent. The 21 reporting Midwestern institutions have received 117,934 applications for 79,106 places, or 1.49 applications per place."

The New York Times published a survey April 17 showing that applications were up approximately 3.8 percent at the eight Ivy League colleges, and 3.2 percent at the women's colleges in the Seven College Conference. The Times said the Ivy League colleges counted 45,591 applications, and sent letters of acceptance this past weekend to 12,354. The seven women's colleges, the Times reported, received 13,034 applications and sent letters to 4,756. The Times said it found that the Ivy League colleges "are moving swiftly away from geographical distribution as a major standard in admitting students, are enrolling more Jews, and rejecting more preparatory school students."

## Highlights of the 1967 OIR Admissions Survey

### For Your Information

Office of Institutional Research  
National Association of State Universities and Land-Grant Colleges  
Circular 102, April 13, 1967

Applications for freshman admission at state and land-grant institutions are up an average of 9.4 percent over last year. This average includes decreases at 14 institutions and no change at 5 others.

State and land-grant institutions expect to increase their freshman classes by an average of six percent next fall. This average includes decreases at five institutions and no change at 14 others.

Competition is keenest in the Northeast, where 10 institutions have received 3.59 applications for every available place. The Western institutions seem best able to accommodate their applicants, having received 1.11 applications for each available place so far.

One out of every seven responding universities expects to reject some qualified in-state applicants. Two out of every seven expect to reject some qualified out-of-state applicants. The reasons most frequently given for the rejection of qualified applicants are inadequate housing, classroom and faculty shortages, and a lower drop-out rate.

One out of every ten institutions raised admission standards for in-state students this year. One out of every six raised standards for out-of-state students.
